

WHAT IS CLAIMED IS:

1. An image forming apparatus comprising:
an image bearing body;
image forming means for forming an image on the
5 image bearing body;
a feed cable for transmitting an electrical signal
to the image forming means;
a holder for holding the feed cable, the holder
having a substrate made of resin and an
10 electro-conductive sheet installed on the substrate;
and
a metal frame attached to the holder;
wherein the electro-conductive sheet is installed
in such a manner as to contact the feed cable and the
15 metal frame.
2. An image forming apparatus according to claim
1, wherein the electro-conductive sheet is removably
adhered on the substrate.
- 20 3. An image forming apparatus according to claim
1, wherein the electro-conductive sheet comprises a
resin layer and a surface electro-conductive layer.
- 25 4. An image forming apparatus according to claim
1, wherein the image forming means comprise an LED
which emits a light beam in response to an image

forming signal, and

the feed cable transmits image signals to the LED.

5 5. An image forming apparatus according to claim
1, wherein the feed cable transmits high frequency
electric signals, and

the feed cable is grounded to the metal frame by
the electro-conductive sheet, thereby reducing high
frequency noises.

10

6. An image forming apparatus according to claim
1, wherein the image forming apparatus further
comprises a fixing member which pressingly fixes the
cable to the electro-conductive sheet.

15

7. An image forming apparatus according to claim
6, wherein the image forming apparatus comprises a
fixing member which inserts the feed cable from a first
direction and a plurality of fixing members which fix
20 the feed cables from a second direction.
